WHAT IS IT

Life for **“INCREMENTAL NUTRITION.”**

BENEFITS APPROVED

Dedicated supplementation to:

- increase total milk proteins and caseins
- increase the efficiency of protein metabolism by decreasing the waste of nitrogenous bases
- improve fertility by lowering free urea in blood
- lower the nitrogenous bases excreted in the environment

Milk quality you are not satisfied with?

Our technical staff in two simple steps is able to balance “in grams” the contribution of Methionine and Lysine in order to maintain a correct 3:1 ratio of these two limiting amino acids.

In dairy cattle diets it is increasingly necessary to do tailoring work to create a product dedicated to the herd.

Don't rely on chance!

The investigation to see if everything is properly balanced consists of three steps:

1. Sampling of the ration given to the animals
2. Laboratory analysis by aminogram
3. Imbalance correction

Expected results result in increased protein and casein within a few weeks.

How?

Increase in protein and casein with the same amount of milk produced or increase in milk production with a consequent increase in the protein produced.

The response to this correction provides, therefore, an expected increase in grams of protein expressed by our cows.

In addition to the qualitative-quantitative improvement, due to a greater “digestibility” of the protein in the ration, there is a general improvement in health and performance due mainly to a lower “waste” of nitrogen fractions that can cause inflammation of different degrees.
